Primary Purpose and Goals:
I need to find all of the children of a particular person (i.e. Brian Schilling)

Under find, type in the father's name (Brian Schilling)

Or maybe I have some other need for the data base

The user can then locate current addresses for the family members

The children of the father should be listed

The user can also pull all data together to create different branches of the family tree

The user can find all of the people living at a particular address

The user may want to find all of the mothers or fathers in this family branch
