Due date: **Friday, Dec. 5 (midnight)**

ASSIGNMENT 5 — PHP MySQL

Problem 1. Write a PHP page that will do a SELECT query based on a paramter that takes value from a form. For e.g. display in a table, the result of the query `SELECT * FROM animal WHERE category="mammal"`, where you get the value for `mammal` from a text field in a form. For an example, look at the PHP page: `http://10.130.10.9/classes/312/php/testing.php`. Here, I have a form in which I can enter a value for the category. This value is then used by PHP to form the complete SQL SELECT statement. The result of the query is then displayed in a table.

The code for the PHP pages we did in class is up on the course website.
