

NASC209 Physical Geology

Date 1-29-20

Sample tray number 8

Original Investigator's name Tasha

Description of sample:

Small smooth stone that has
Green + pinkish colors (almost
a marble effect)

Speculate (hypothesize!) on how the sample may have been
formed or acquired its present appearance.

I think it could have formed
from weather erosion on a bigger
rock found above ground because
of how smooth it is.

Pair partner's name Clay

Description modifications w/ pair partner:

- Forms rounded point.
- green, blue, grey, salmon

Formation speculation modifications w/ pair partner:

After being formed by heat
and pressure, it seems to have
been eroded by weather or by
being in a body of water.
